Public Health and Vector Control Guidelines

Sahyadripur Municipal Corporation

1. Purpose

To reduce the incidence of vector-borne disease, especially dengue and malaria, through routine and outbreak control measures.

2. Routine measures

Larval surveys are done fortnightly in every ward from June to November. Fogging cycles run every 15 days in wards with high mosquito density and weekly in wards reporting fever clusters.

3. Outbreak triggers

An outbreak alert is declared when a ward records more than 30 percent growth in public health complaints week on week for three consecutive weeks, or when five or more dengue cases are reported from one locality. The alert mobilises fogging teams within 24 hours, door-to-door surveys and notification to the district health office.

4. Seasonality

Public health complaints peak between July and October. Additional teams should be deployed from the first week of July in Ambedkar Nagar, Tilak Road and other wards with historically high counts.
